

## What makes a tree 'balanced'?

In this chapter, we are going to study what makes a tree balanced. We are also going to look at a high-level description of the algorithm used to determine if a given tree is balanced.

### We'll cover the following

- Introduction
- Checking if a binary tree is balanced
  - High-level Algorithm to determine if a tree is height-balanced
- Example
  - Quiz:

## Introduction #

A binary tree is height-balanced if, for each node in the tree, the difference between the height of the right subtree and the left subtree is at most one.

$$|Height(LeftSubTree) - Height(RightSubTree)| \leq 1$$

Look at the illustration below of a height-balanced tree. Notice how the left and right sub-trees all appear at the same height.

## Checking if a binary tree is balanced #

Try to guess if the following tree is balanced or not before looking at the answer!

Hide Hint

$$|Height(LeftSubTree) - Height(RightSubTree)| \leq 1$$

This tree is height-balanced! How did we determine that? Let's go through break our thought process down into a series of steps to find out.

## High-level Algorithm to determine if a tree is height-balanced #

1. Start from the leaf nodes and move towards the root
2. Along with traversing the tree, compute heights of the *left-subtree* and *right-subtree* of each node. The height of a leaf node is always **0**
3. At each node, check if the difference between the height of the left and right sub-tree is more than **1**, if so, it means that the tree is not balanced.
4. If you have completely traversed the tree and haven't caught the above condition, then the tree is balanced.

## Example #

Implementing what we learned from the above four steps in the illustration below. Here, *HLT* means the height of the Left Tree and *HRT* means the height of the right tree:

Let's start from the lowest level!

1 of 11

What will be the height of Left and Right Subtree at this level?

2 of 11

Since there are no more levels in the bottom so, height = 0

3 of 11

Moving on to the next level...

4 of 11

At this level, the node has a left child but no right child

5 of 11

So, HLT will be 1 and HRT will be 0!

6 of 11

7 of 11

8 of 11

Now moving forward to the root..

9 of 11

That's right! Since at left there are two levels so, HLT = 2

10 of 11

There's only  
one level at  
the right so,  
HRT = 1

11 of 11

— {}

## Quiz: #

Now, to test your concept about checking if a tree is balanced or not, see the example below and try to solve it on a piece of paper. For help, you have a hint down below, but try to do it yourself first!

Q  Is the above tree balanced?

☐ A) Yes

☒ B) No

Explanation

Observe Node 2.

Great, you got it right!

Retake Quiz

In the upcoming lessons, we will go through a bunch of different types of trees one at a time, starting from Binary Tree, some further types to their more complex versions like 2-3 and AVL Trees etc.
